

17CSL58: DBMS LABORATORY WITH MINI PROJECT

Course objectives: This course will enable students to

- Foundation knowledge in database concepts, technology and practice to groom students into well-informed database application developers.
- Strong practice in SQL programming through a variety of database problems.
- Develop database applications using front-end tools and back-end DBMS.

Database: A Database is a collection of interrelated data and a Database Management System is a software system that enables users to define, create and maintain the database and which provides controlled access to the database

SQL: It is structured query language, basically used to pass the query to retrieve and manipulate the information from database. Depending upon the nature of query, SQL is divided into different components:

- **DDL**(Data Definition Language)
- **DML**(Data Manipulation Language)
- **DCL**(Data Control Language)

DDL: The Data Definition Language (DDL) is used to create the database (i.e. tables, keys, relationships etc), maintain the structure of the database and destroy databases and database objects.

Eg. Create, Drop, Alter, Describe, Truncate

1. **CREATE** statements: It is used to create the table.

Syntax:

CREATE TABLE table_name(columnName1 datatype(size), columnName2 datatype(size),.....);

2. **DROP statements:** To destroy an existing database, table, index, or view. If a table is dropped all records held within it are lost and cannot be recovered.

Syntax:

DROP TABLE table_name;

3. **ALTER statements:** To modify an existing database object.

- **Adding new columns:**

Syntax:

Alter table table_name Add(New_columnName1 datatype(size), New_columnName2 datatype(size),.....)

- **Dropping a columns from a**

table : Syntax:

Alter table table_name DROP column columnName;

- **Modifying Existing columns:**

Syntax:

Alter table table_name Modify (columnName1 Newdatatype(Newsize));

4. **Describe statements:** To describe the structure (column and data types) of an existing database, table, index, or view.

Syntax:

DESC table_name;

5. **Truncate statements:** To destroy the data in an existing database, table, index, or view. If a table is truncated all records held within it are lost and cannot be recovered but the table structure is maintained.

Syntax :

TRUNCATE TABLE table_name;

Data Manipulation Language (DML):

- A Data Manipulation Language enables programmers and users of the database to retrieve insert, delete and update data in a database. e.g. INSERT, UPDATE, DELETE, SELECT.

INSERT: INSERT statement adds one or more records to any single table in a relational database.

Syntax:

INSERT INTO tablename VALUES (expr1,expr2,.....);

UPDATE: UPDATE statement that changes the data of one or more records in a table. Either all the rows can be updated, or a subset may be chosen using a condition.

Syntax:

UPDATE table_name SET column_name = value [, column_name = value ...] [WHERE condition]

DELETE: DELETE statement removes one or more records from a table. A subset may be defined for deletion using a condition, otherwise all records are removed.

Syntax:

DELETE FROM tablename WHERE condition;

SELECT: SELECT statement returns a result set of records from one or more tables.

The select statement has optional clauses:

- WHERE specifies which rows to retrieve
- GROUP BY groups rows sharing a property so that an aggregate function can be applied to each group having group.

- HAVING selects among the groups defined by the GROUP BY clause.
- ORDER BY specifies an order in which to return the rows.

Syntax:

SELECT <attribute list> FROM <table list>
WHERE <condition> Where

- Attribute list is a list of attribute name whose values to be retrieved by the query.
- Table list is a list of table name required to process query.
- Condition is a Boolean expression that identifies the tuples to be retrieved by query.

Data Constraints are the business Rules which are enforced on the data being stored in a table are called Constraints.

Types of Data Constraints

1. I/O Constraint This type of constraint determines the speed at which data can be inserted or extracted from an Oracle table. I/O Constraints is divided into two different types
 - The Primary Key Constraint
 - The Foreign Key Constraint
2. Business rule Constraint This type of constraint is applied to data prior the data being Inserted into table columns.
 - Column level
 - Table level

The PRIMARY KEY defined at column level**Syntax:**

```
CREATETABLEtablename
(Columnname1DATATYPE
CONSTRAINT <constraintname1>
PRIMARY KEY, Columnname2
DATATYPE,      columnname3
DATATYPE,.....);
```

The PRIMARY KEY defined at table level**Syntax:**

```
CREATE TABLE tablename (Columnname1 DATATYPE, columnname2 DATATYPE,
columnname3 DATATYPE, PRIMARY KEY (columnname1, columnname2));
```

The FOREIGN KEY defined at column level**Syntax**

```
CREATE TABLE tablename (Columnname1
tablename[(columnname)] [ON DELETE CASCADE],
columnname3 DATATYPE ,.....);
```

DATATYPE columnname2 REFERENCES DATATYPE ,

The table in which FOREIGN KEY is defined is called FOREIGN TABLE or DETAIL TABLE. The table in which PRIMARY KEY is defined and referenced by FOREIGN KEY is called PRIMARY TABLE or MASTER TABLE.

ON DELETE CASCADE is set then DELETE operation in master table will trigger the DELETE operation for corresponding records in the detail table.

The FOREIGN KEY defined at table level

Syntax:

```
CREATE TABLE tablename (Columnname1 DATATYPE, columnname2 DATATYPE,
columnname3 DATATYPE, PRIMARY KEY (columnname1, columnname2), FOREIGN KEY
(columnname2) REFERENCES tablename2;
```

A CONSTRAINT can be given User Defined Name, the syntax is:
CONSTRAINT <constraint name><constraint definition>

The CHECK Constraint defined at column level

Syntax:

```
CREATE TABLE tablename (Columnname1 DATATYPE CHECK (logical expression),
columnname2 DATATYPE, columnname3 DATATYPE,...);
```

The CHECK Constraint defined at table level

Syntax:

```
CREATE TABLE tablename (Columnname1 DATATYPE, columnname2 DATATYPE,
columnname3 DATATYPE, CHECK (logical expression1), CHECK (logical expression2));
```

The UNIQUE Constraint defined at the column level

Syntax:

```
CREATE TABLE tablename (Columnname1 DATATYPE UNIQUE, columnname2 DATATYPE
UNIQUE, columnname3 DATATYPE ...);
```

The UNIQUE Constraint defined at the the table level

Syntax:

```
CREATE TABLE tablename (Columnname1 DATATYPE, columnname2 DATATYPE,
columnname3 DATATYPE, UNIQUE(columnname1));
```

NOT NULL constraint defined at column level :

Syntax:

```
CREATE TABLE tablename (Columnname1 DATATYPE NOT NULL, columnname2
DATATYPE NOT NULL, columnname3 DATATYPE,...);
```

Note:

The NOT NULL constraint can only be applied at column level.

ER- Diagram: It is an Entity –Relationship diagram which is used to represent the relationship between different entities. An entity is an object in the real world which is distinguishable from other objects. The overall logical structure of a database can be expressed graphically by an ER diagram, which is built up from following components.

- Rectangles: represent entity sets.
- Ellipses: represent attributes.
- Diamonds: represent relationships among entity sets.
- Lines: link attribute to entity sets and entity sets to relationships.

Mapping Cardinalities: It expresses the number of entities to which another entity can be associated via a relationship set. For a binary relationship set R between entity sets A and B. The Mapping Cardinalities must be one of the following.

- One to one
- One to many
- Many to one
- Many to many

LAB EXPERIMENTS

PART A: SQL PROGRAMMING

A. Consider the following schema for a Library Database:

BOOK (*Book_id*, *Title*, *Publisher_Name*, *Pub_Year*)

BOOK_AUTHORS (*Book_id*, *Author_Name*)

PUBLISHER (*Name*, *Address*, *Phone*)

BOOK_COPIES (*Book_id*, *Branch_id*, *No-of_Copies*)

BOOK_LENDING (*Book_id*, *Branch_id*, *Card_No*, *Date_Out*, *Due_Date*)

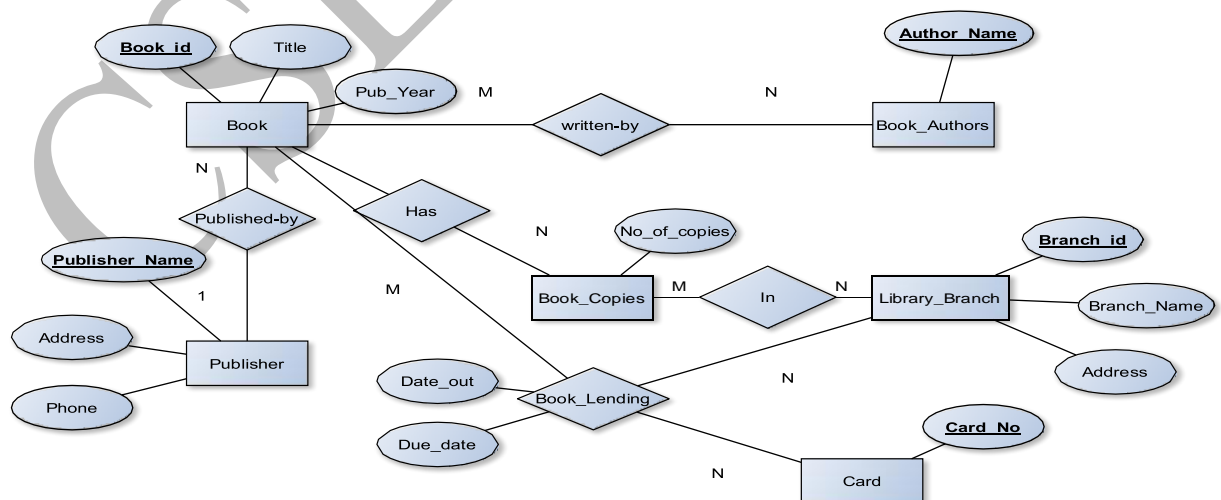

LIBRARY_BRANCH (*Branch_id*, *Branch_Name*, *Address*)

Write SQL queries to

1. Retrieve details of all books in the library – id, title, name of publisher, authors, number of copies in each branch, etc.
2. Get the particulars of borrowers who have borrowed more than 3 books, but from Jan 2017 to Jun 2017
3. Delete a book in BOOK table. Update the contents of other tables to reflect this data manipulation operation.
4. Partition the BOOK table based on year of publication. Demonstrate its working with a simple query.
5. Create a view of all books and its number of copies that are currently available in the Library.

Solution:

Entity-Relationship Diagram

Schema Diagram

Table Creation:

PUBLISHER

```
SQL> CREATE TABLE PUBLISHER(  
      NAME VARCHAR(18) PRIMARY KEY,  
      ADDRESS VARCHAR(10),  
      PHONE VARCHAR(10));
```

Table created.

BOOK

```
SQL> CREATE TABLE BOOK(  
      BOOK_ID INTEGER PRIMARY KEY,  
      TITLE VARCHAR(20),  
      PUBLISHER_NAME VARCHAR(20)  
      PUB_YEAR NUMBER(4),  
      FOREIGN KEY(PUBLISHER_NAME) REFERENCES PUBLISHER(NAME) ON DELETE  
      CASCADE  
      );
```

Table created.

BOOK_AUTHORS

```
SQL> CREATE TABLE BOOK_AUTHORS(  
      BOOK_ID INTEGER,  
      AUTHOR_NAME VARCHAR(20),  
      PRIMARY KEY(BOOK_ID),  
      FOREIGN KEY(BOOK_ID) REFERENCES BOOK(BOOK_ID) ON DELETE CASCADE);
```

Table created.

LIBRARY_BRANCH

```
SQL> CREATE TABLE LIBRARY_BRANCH(  
      BRANCH_ID INTEGER PRIMARY KEY,  
      BRANCH_NAME VARCHAR(18),  
      ADDRESS VARCHAR(15));
```

Table created.

BOOK_COPIES

```
SQL> CREATE TABLE BOOK_COPIES (
    BOOK_ID INTEGER,
    BRANCH_ID INTEGER,
    NO_OF_COPIES INTEGER,
    FOREIGN KEY (BOOK_ID) REFERENCES BOOK (BOOK_ID) ON DELETE CASCADE,
    FOREIGN KEY (BRANCH_ID) REFERENCES LIBRARY_BRANCH (BRANCH_ID) ON
    DELETE CASCADE,
    PRIMARY KEY (BOOK_ID, BRANCH_ID));
```

Table created.

BOOK_LENDING

```
SQL> CREATE TABLE BOOK_LENDING (
    BOOK_ID INTEGER,
    BRANCH_ID INTEGER,
    CARD_NO INTEGER,
    DATE_OUT DATE,
    DUE_DATE DATE,
    PRIMARY KEY (BOOK_ID, BRANCH_ID, CARD_NO),
    FOREIGN KEY (BOOK_ID) REFERENCES BOOK (BOOK_ID) ON DELETE CASCADE,
    FOREIGN KEY (BRANCH_ID) REFERENCES LIBRARY_BRANCH (BRANCH_ID) ON
    DELETE CASCADE,
);
```

Table created.

Values for tables:

PUBLISHER

```
SQL> INSERT INTO PUBLISHER VALUES ('PEARSON', 'BANGALORE', '9875462530');
SQL> INSERT INTO PUBLISHER VALUES ('MCGRAW', 'NEWDELHI', '7845691234');
SQL> INSERT INTO PUBLISHER VALUES ('SAPNA', 'BANGALORE', '7845963210');
```

BOOK

```
SQL> INSERT INTO BOOK VALUES (1111, 'SE', 'PEARSON', 2005);
SQL> INSERT INTO BOOK VALUES (2222, 'DBMS', 'MCGRAW', 2004);
SQL> INSERT INTO BOOK VALUES (3333, 'ANATOMY', 'PEARSON', 2010); SQL>
INSERT INTO BOOK VALUES (4444, 'ENCYCLOPEDIA', 'SAPNA', 2010);
```

BOOK_AUTHORS

```
SQL> INSERT INTO BOOK_AUTHORS VALUES (1111, 'SOMMERVILLE');
SQL> INSERT INTO BOOK_AUTHORS VALUES (2222, 'NAVATHE'); SQL>
INSERT INTO BOOK_AUTHORS VALUES (3333, 'HENRY GRAY'); SQL>
```

```
INSERT INTO BOOK_AUTHORS VALUES (4444, 'THOMAS');
```

LIBRARY_BRANCH

```
SQL> INSERT INTO LIBRARY_BRANCH VALUES (11, 'CENTRAL TECHNICAL', 'MG ROAD');
```

```
SQL> INSERT INTO LIBRARY_BRANCH VALUES (22, 'MEDICAL', 'BH ROAD');
```

```
SQL> INSERT INTO LIBRARY_BRANCH VALUES (33, 'CHILDREN', 'SS PURAM');
```

```
SQL> INSERT INTO LIBRARY_BRANCH VALUES (44, 'SECRETARIAT', 'SIRAGATE');
```

```
SQL> INSERT INTO LIBRARY_BRANCH VALUES (55, 'GENERAL', 'JAYANAGAR');
```

BOOK_COPIES

```
SQL> INSERT INTO BOOK_COPIES VALUES (1111, 11, 5);
```

```
SQL> INSERT INTO BOOK_COPIES VALUES (3333, 22, 6);
```

```
SQL> INSERT INTO BOOK_COPIES VALUES (4444, 33, 10);
```

```
SQL> INSERT INTO BOOK_COPIES VALUES (2222, 11, 12);
```

```
SQL> INSERT INTO BOOK_COPIES VALUES (4444, 55, 3);
```

BOOK_LENDING

```
SQL> INSERT INTO BOOK_LENDING VALUES (2222, 11, 1, '10-JAN-2017', '20-AUG-2017');
```

```
SQL> INSERT INTO BOOK_LENDING VALUES (3333, 22, 2, '09-JUL-2017', '12-AUG-2017');
```

```
SQL> INSERT INTO BOOK_LENDING VALUES (4444, 55, 1, '11-APR-2017', '09-AUG-2017');
```

```
SQL> INSERT INTO BOOK_LENDING VALUES (2222, 11, 5, '09-AUG-2017', '19-AUG-2017');
```

```
SQL> INSERT INTO BOOK_LENDING VALUES (4444, 33, 1, '10-JUN-2017', '15-AUG-2017');
```

```
SQL> INSERT INTO BOOK_LENDING VALUES (1111, 11, 1, '12-MAY-2017', '10-JUN-2017');
```

```
SQL> INSERT INTO BOOK_LENDING VALUES (3333, 22, 1, '10-JUL-2017', '15-JUL-2017');
```

```
SQL> SELECT * FROM BOOK;

CENTRAL TECHNICAL	1111	SE	PEARSON	SOMMERVILLE	5
CENTRAL TECHNICAL	2222	DBMS	MCGRAW	NAVATHE	12

- 2) Get the particulars of borrowers who have borrowed more than 3 books, but from Jan 2017 to Jun 2017.

```
SELECT CARD_NO
FROM BOOK_LENDING
WHERE DATE_OUT BETWEEN '01-JAN-2017' AND '30-JUN-2017'
GROUP BY CARD_NO
HAVING COUNT(*) > 3;
```

```
CARD_NO
-----
1
```

- 3) Delete a book in BOOK table. Update the contents of other tables to reflect this data manipulation operation.

```
DELETE FROM BOOK
WHERE BOOK_ID = '3333';
```

1 row deleted.

```
SQL> SELECT * FROM BOOK;
```

BOOK_ID	TITLE	PUBLISHER_NAME	PUB_YEAR
1111	SE	PEARSON	2005
2222	DBMS	MCGRAW	2004
4444	ENCYCLOPEDIA	SAPNA	2010

```
SQL> SELECT * FROM
        BOOK_COPIES;
        BOOK_ID BRANCH_ID
        NO_OF_COPIES
```

BOOK_ID	BRANCH_ID	NO_OF_COPIES
1111	11	5
4444	33	10
2222	11	12
4444	55	3

```
SQL> SELECT * FROM
        BOOK_LENDING;
```

BOOK_ID	BRANCH_ID	CARD_NO	DATE_OUT	DUE_DATE
2222	11	1	10-JAN-17	20-AUG-17
4444	55	1	11-APR-17	09-AUG-17
2222	11	5	09-AUG-17	19-AUG-17
4444	33	1	10-JUN-17	15-AUG-17
1111	11	1	12-MAY-17	10-JUN-17

4) Partition the BOOK table based on year of publication. Demonstrate its working with a simple query.

```
CREATE VIEW V_PUBLICATION AS
SELECT PUB_YEAR
FROM BOOK;
```

```
SELECT * FROM V_PUBLICATIONS;
```

```
PUB_YEAR
2004
2005
2010
2010
```

5) Create a view of all books and its number of copies that are currently available in the Library.

```
CREATE VIEW BOOKS_AVAILABLE AS  
SELECT B.BOOK_ID, B.TITLE, C.NO_OF_COPIES  
FROM LIBRARY_BRANCH L, BOOK B, BOOK_COPIES C  
WHERE B.BOOK_ID = C.BOOK_ID AND  
L.BRANCH_ID=C.BRANCH_ID;
```

View created.

SQL> SELECT * FROM BOOKS_AVAILABLE;

BOOK_I D	TITLE	NO_OF_COPIES
1111	SE	5
3333	ANOTOMY	6
4444	ENCYCLOPEDIA	10
2222	DBMS	12
4444	ENCYCLOPEDIA	3

B. Consider the following schema for Order Database:

SALESMAN (*Salesman_id*, Name, City, Commission)

CUSTOMER (*Customer_id*, Cust_Name, City, Grade, Salesman_id)

ORDERS (*Ord_No*, Purchase_Amt, Ord_Date, Customer_id, Salesman_id)

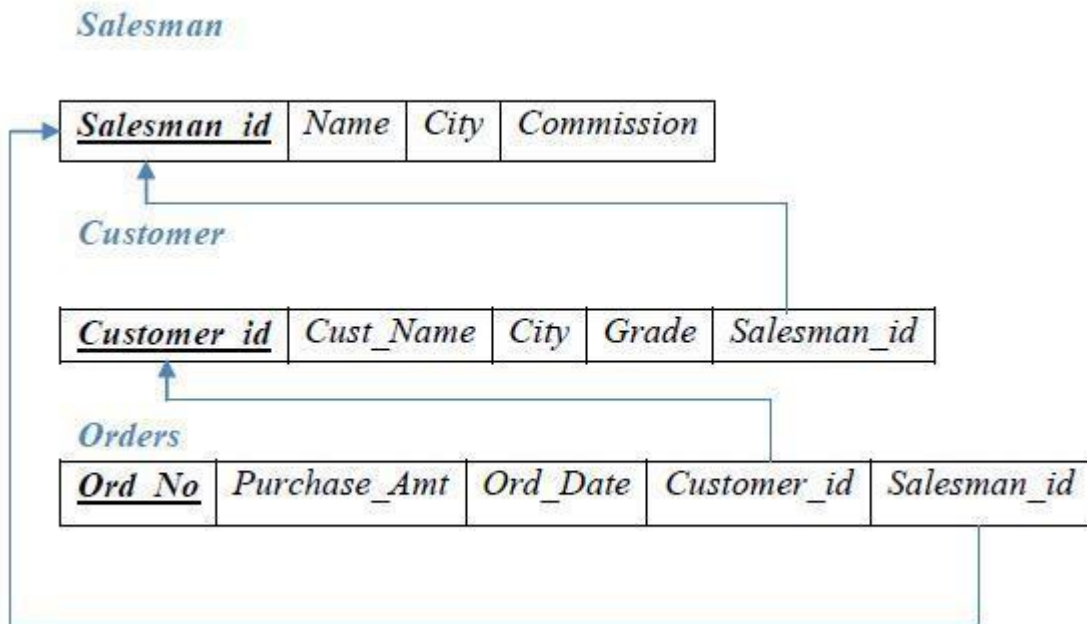

Write SQL queries to

1. Count the customers with grades above Bangalore's average.
2. Find the name and numbers of all salesmen who had more than one customer.
3. List all salesmen and indicate those who have and don't have customers in their cities (Use UNION operation.)
4. Create a view that finds the salesman who has the customer with the highest order of a day.
5. Demonstrate the DELETE operation by removing salesman with id 1000. All his orders must also be deleted.

Solution:

Entity-Relationship Diagram

Schema Diagram**Table Creation**

```
CREATE TABLE SALESMAN (SALESMAN_ID NUMBER (4),
NAME VARCHAR2 (20),
CITY VARCHAR2 (20),
COMMISSION VARCHAR2 (20), PRIMARY KEY(SALESMAN_ID));
```

```
CREATE TABLE CUSTOMER1 (CUSTOMER_ID NUMBER (4),
CUST_NAME VARCHAR2 (20),
CITY VARCHAR2 (20),
GRADE NUMBER (3),
SALESMAN_ID NUMBER (4),
PRIMARY KEY (CUSTOMER_ID),
FOREIGN KEY(SALESMAN_ID) REFERENCES SALESMAN (SALESMAN_ID) ON
DELETE SET NULL);
```

```
CREATE TABLE ORDERS (ORD_NO NUMBER (5),
PURCHASE_AMT NUMBER (10, 2),
ORD_DATE DATE,
CUSTOMER_ID NUMBER (4),
SALESMAN_ID NUMBER (4),
PRIMARY KEY (ORD_NO),
CUSTOMER_ID REFERENCES CUSTOMER1 (CUSTOMER_ID) ON DELETE
CASCADE, SALESMAN_ID REFERENCES SALESMAN (SALESMAN_ID) ON
DELETE CASCADE);
```

INSERT INTO CUSTOMER1 VALUES (12, 'BHASKAR','CHENNAI', 400, 2000);
INSERT INTO CUSTOMER1 VALUES (13, 'CHETHAN','BANGALORE', 200, 2000);
INSERT INTO CUSTOMER1 VALUES (14, 'MAMATHA','BANGALORE', 400, 3000);
```

```
INSERT INTO ORDERS VALUES (50, 5000, '04-MAY-17', 10, 1000);
INSERT INTO ORDERS VALUES (51, 450, '20-JAN-17', 10, 2000);
```

```

INSERT INTO ORDERS VALUES (52, 1000, '24-FEB-17', 13, 2000);
INSERT INTO ORDERS VALUES (53, 3500, '13-APR-17', 14, 3000);
INSERT INTO ORDERS VALUES (54, 550, '09-MAR-17', 12, 2000);

```

```

SELECT * FROM SALESMAN;

```

SALESMAN_ID	NAME	CITY	COMMISSION
1000	JOHN	BANGALORE	25 %
2000	RAVI	BANGALORE	20 %
3000	KUMAR	MYSORE	15 %
4000	SMITH	DELHI	30 %
5000	HARSHA	HYDRABAD	15 %

```

SELECT * FROM CUSTOMER1;

```

CUSTOMER_ID	CUST_NAME	CITY	GRADE	SALESMAN_ID
10	PREETHI	BANGALORE	100	1000
11	UIVEK	MANGALORE	300	1000
12	BHASKAR	CHENNAI	400	2000
13	CHETHAN	BANGALORE	200	2000
14	MAMATHA	BANGALORE	400	3000

```

SELECT * FROM ORDERS;

```

ORD_NO	PURCHASE_AMT	ORD_DATE	CUSTOMER_ID	SALESMAN_ID
50	5000	04-MAY-17	10	1000
51	450	20-JAN-17	10	2000
52	1000	24-FEB-17	13	2000
53	3500	13-APR-17	14	3000
54	550	09-MAR-17	12	2000

Queries:

- Count the customers with grades above Bangalore's average.

```

SELECT GRADE, COUNT (DISTINCT CUSTOMER_ID)
FROM CUSTOMER1
GROUP BY GRADE
HAVING GRADE > (SELECT AVG(GRADE)
FROM CUSTOMER1
WHERE CITY='BANGALORE');

```

GRADE	COUNT(DISTINCTCUSTOMER_ID)
300	1
400	2

2. Find the name and numbers of all salesmen who had more than one customer.

```
SELECT SALESMAN_ID, NAME
FROM SALESMAN A
WHERE 1 < (SELECT COUNT (*)
          FROM CUSTOMER1
          WHERE SALESMAN_ID=A.SALESMAN_ID);
```

SALESMAN_ID NAME

```
-----
1000 JOHN
2000 RAVI
```

3. List all salesmen and indicate those who have and don't have customers in their cities (Use UNION operation.)

```
SELECT SALESMAN.SALESMAN_ID, NAME, CUST_NAME, COMMISSION
FROM SALESMAN, CUSTOMER1
WHERE SALESMAN.CITY = CUSTOMER1.CITY
UNION
SELECT SALESMAN_ID, NAME, 'NO MATCH', COMMISSION
FROM SALESMAN
WHERE NOT CITY = ANY
(SELECT CITY
 FROM CUSTOMER1)
ORDER BY 2 DESC;
```

SALESMAN_ID	NAME	CUST_NAME	COMMISSION
4000	SMITH	NO MATCH	30 %
2000	RAVI	CHETHAN	20 %
2000	RAVI	MAMATHA	20 %
2000	RAVI	PREETHI	20 %
3000	KUMAR	NO MATCH	15 %
1000	JOHN	CHETHAN	25 %
1000	JOHN	MAMATHA	25 %
1000	JOHN	PREETHI	25 %
5000	HARSHA	NO MATCH	15 %

4. Create a view that finds the salesman who has the customer with the highest order of a day.

```
CREATE VIEW ELITSALESMAN AS
SELECT B.ORD_DATE, A.SALESMAN_ID, A.NAME
FROM SALESMAN A, ORDERS B
```

```

WHERE A.SALESMAN_ID = B.SALESMAN_ID
AND B.PURCHASE_AMT=(SELECT MAX (PURCHASE_AMT)
                     FROM ORDERS C
                     WHERE C.ORD_DATE = B.ORD_DATE);

```

ORD_DATE	SALESMAN_ID	NAME
04-MAY-17	1000	JOHN
20-JAN-17	2000	RAVI
24-FEB-17	2000	RAVI
13-APR-17	3000	KUMAR
09-MAR-17	2000	RAVI

5. Demonstrate the DELETE operation by removing salesman with id 1000. All his orders must also be deleted.

Use ON DELETE CASCADE at the end of foreign key definitions while creating child table orders and then execute the following:

Use ON DELETE SET NULL at the end of foreign key definitions while creating child table customers and then executes the following:

```

DELETE FROM SALESMAN
WHERE SALESMAN_ID=1000;

```

```

SQL> DELETE FROM SALESMAN
      2 WHERE SALESMAN_ID=1000;

```

1 row deleted.

```

SQL> SELECT * FROM SALESMAN;

```

SALESMAN_ID	NAME	CITY	COMMISSION
2000	RAVI	BANGALORE	20 %
3000	KUMAR	MYSORE	15 %
4000	SMITH	DELHI	30 %
5000	HARSHA	HYDRABAD	15 %

C. Consider the schema for Movie Database:

ACTOR (Act_id, Act_Name, Act_Gender)

DIRECTOR (Dir_id, Dir_Name, Dir_Phone)

MOVIES (Mov_id, Mov_Title, Mov_Year, Mov_Lang, Dir_id)

MOVIE_CAST (Act_id, Mov_id, Role)

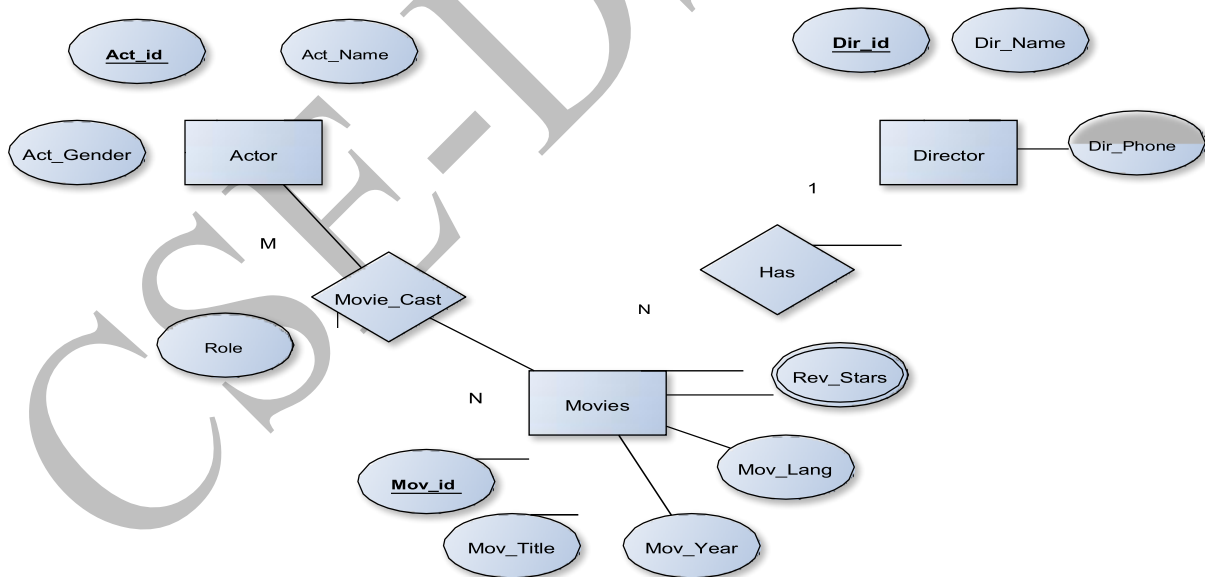

RATING (Mov_id, Rev_Stars)

Write SQL queries to

1. List the titles of all movies directed by 'Hitchcock'.
2. Find the movie names where one or more actors acted in two or more movies.
3. List all actors who acted in a movie before 2000 and also in a movie after 2015 (use JOIN operation).
4. Find the title of movies and number of stars for each movie that has at least one rating and find the highest number of stars that movie received. Sort the result by movie title.
5. Update rating of all movies directed by 'Steven Spielberg' to 5.

Solution:

1003	5
1004	5

D. Consider the schema for College Database:**STUDENT** (USN, SName, Address, Phone, Gender)**SEMSEC** (SSID, Sem, Sec)**CLASS** (USN, SSID)**SUBJECT** (Subcode, Title, Sem, Credits)**IAMARKS** (USN, Subcode, SSID, Test1, Test2, Test3, FinalIA)

Write SQL queries to

1. List all the student details studying in fourth semester 'C' section.
2. Compute the total number of male and female students in each semester and in each section.
3. Create a view of Test1 marks of student USN '1BI15CS101' in all subjects.
4. Calculate the FinalIA (average of best two test marks) and update the corresponding table for all students.
5. Categorize students based on the following criterion:
 If FinalIA = 17 to 20 then CAT = 'Outstanding'
 If FinalIA = 12 to 16 then CAT = 'Average'
 If FinalIA < 12 then CAT = 'Weak'
 Give these details only for 8th semester A, B, and C section students.

2. Compute the total number of male and female students in each semester and in each section.

```
SELECT SS.SEM, SS.SEC, S.GENDER, COUNT (S.GENDER) AS COUNT
FROM STUDENT S, SEMSEC SS, CLASS C
WHERE S.USN = C.USN AND
SS.SSID = C.SSID
GROUP BY SS.SEM, SS.SEC, S.GENDER
ORDER BY SEM;
```

SEM	S	G	COUNT
3	A	M	1
3	B	F	1
3	C	M	1
4	A	F	1
4	A	M	1
4	B	M	1
4	C	M	1
7	A	F	1
7	A	M	2
8	A	F	1
8	A	M	1
8	B	F	1
8	C	F	1

3. Create a view of Test1 marks of student USN '1BI15CS101' in all subjects.

```
CREATE VIEW STU_TEST1_MARKS_VIEW
AS
SELECT TEST1, SUBCODE
FROM IAMARKS
WHERE USN = '1RN13CS091';
```

TEST1	SUBCODE
15	10CS81
12	10CS82
19	10CS83
20	10CS84
15	10CS85

4. Calculate the FinalIA (average of best two test marks) and update the corresponding table for all students.

```
CREATE OR REPLACE PROCEDURE AVGMARKS IS
  CURSOR C_IAMARKS IS
  SELECT GREATEST(TEST1,TEST2) AS A, GREATEST(TEST1,TEST3) AS B,
  GREATEST(TEST3,TEST2) AS C
  FROM IAMARKS
  WHERE FINALIA IS NULL
  FOR UPDATE;

  C_A NUMBER;
  C_B NUMBER;
  C_C NUMBER;
  C_SM NUMBER;
  C_AV NUMBER;

BEGIN
  OPEN C_IAMARKS;
  LOOP
    FETCH C_IAMARKS INTO C_A, C_B, C_C;
    EXIT WHEN C_IAMARKS%NOTFOUND;
    --DBMS_OUTPUT.PUT_LINE(C_A || ' ' || C_B || ' ' || C_C);
    IF (C_A != C_B) THEN
      C_SM:=C_A+C_B;
    ELSE
      C_SM:=C_A+C_C;
    END IF;

    C_AV:=C_SM/2;
    --DBMS_OUTPUT.PUT_LINE('SUM = '||C_SM);
    --DBMS_OUTPUT.PUT_LINE('AVERAGE = '||C_AV);
    UPDATE IAMARKS SET FINALIA=C_AV WHERE CURRENT OF C_IAMARKS;

  END LOOP;
  CLOSE C_IAMARKS;
END;
/
```

Note: Before execution of PL/SQL procedure, IAMARKS table contents are:

SELECT * FROM IAMARKS;

SQL> SELECT * FROM IAMARKS;

USN	SUBCODE	SSID	TEST1	TEST2	TEST3	FINALIA
1RN13CS091	10CS81	CSE8C	15	16	18	
1RN13CS091	10CS82	CSE8C	12	19	14	
1RN13CS091	10CS83	CSE8C	19	15	20	
1RN13CS091	10CS84	CSE8C	20	16	19	
1RN13CS091	10CS85	CSE8C	15	15	12	

Below SQL code is to invoke the PL/SQL stored procedure from the command line:

```
BEGIN
AVGMARKS;
END;
```

SQL> select * from IAMARKS;

USN	SUBCODE	SSID	TEST1	TEST2	TEST3	FINALIA
1RN13CS091	10CS81	CSE8C	15	16	18	17
1RN13CS091	10CS82	CSE8C	12	19	14	17
1RN13CS091	10CS83	CSE8C	19	15	20	20
1RN13CS091	10CS84	CSE8C	20	16	19	20
1RN13CS091	10CS85	CSE8C	15	15	12	15

5. Categorize students based on the following criterion:

If FinalIA = 17 to 20 then CAT = 'Outstanding'

If FinalIA = 12 to 16 then CAT = 'Average'

If FinalIA < 12 then CAT = 'Weak'

Give these details only for 8th semester A, B, and C section students.

```
SELECT S.USN,S.SNAME,S.ADDRESS,S.PHONE,S.GENDER,
(CASE
WHEN IA.FINALIA BETWEEN 17 AND 20 THEN 'OUTSTANDING'
WHEN IA.FINALIA BETWEEN 12 AND 16 THEN 'AVERAGE'
ELSE 'WEAK'
END) AS CAT
FROM STUDENT S, SEMSEC SS, IAMARKS IA, SUBJECT SUB
WHERE S.USN = IA.USN AND
SS.SSID = IA.SSID AND
SUB.SUBCODE = IA.SUBCODE AND
SUB.SEM = 8;
```

USN	SNAME	ADDRESS	PHONE	G	CAT
1RN13CS091	TEESHA	BENGALURU	7712312312	F	OutStanding
1RN13CS091	TEESHA	BENGALURU	7712312312	F	OutStanding
1RN13CS091	TEESHA	BENGALURU	7712312312	F	OutStanding
1RN13CS091	TEESHA	BENGALURU	7712312312	F	OutStanding
1RN13CS091	TEESHA	BENGALURU	7712312312	F	Average

E. Consider the schema for Company Database:

EMPLOYEE (SSN, Name, Address, Sex, Salary, SuperSSN, DNo)

DEPARTMENT (DNo, DName, MgrSSN, MgrStartDate)

DLOCATION (DNo, DLoc)

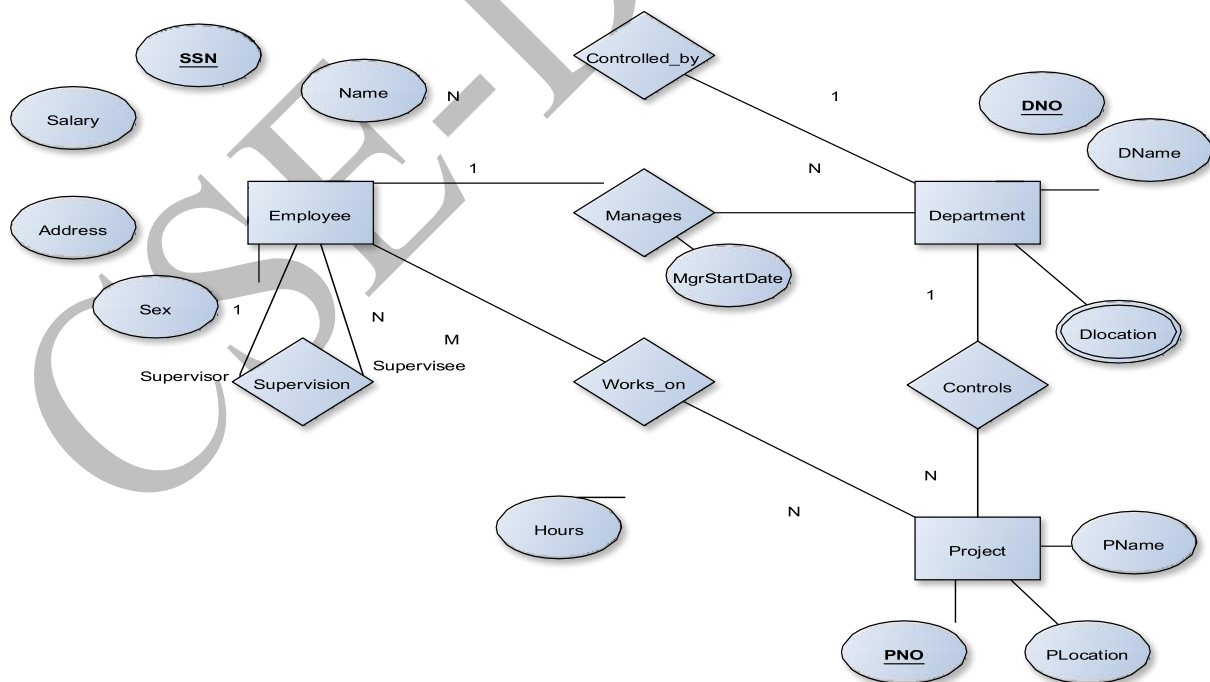

PROJECT (PNo, PName, PLocation, DNo)

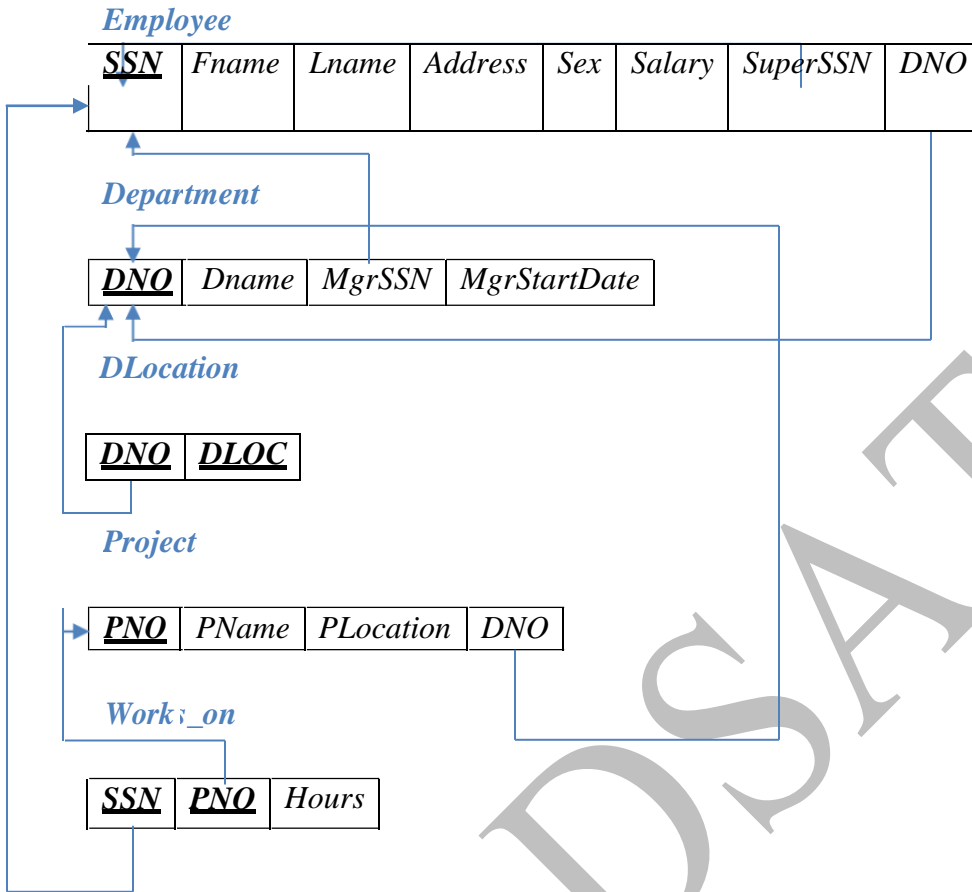

WORKS_ON (SSN, PNo, Hours)

Write SQL queries to

1. Make a list of all project numbers for projects that involve an employee whose last name is 'Scott', either as a worker or as a manager of the department that controls the project.
2. Show the resulting salaries if every employee working on the 'IoT' project is given a 10 percent raise.
3. Find the sum of the salaries of all employees of the 'Accounts' department, as well as the maximum salary, the minimum salary, and the average salary in this department
4. Retrieve the name of each employee who works on all the projects controlled by department number 5 (use NOT EXISTS operator). For each department that has more than five employees, retrieve the department number and the number of its employees who are making more than Rs. 6,00,000.

Entity-Relationship Diagram

Schema Diagram**Table Creation**

```
CREATE TABLE DEPARTMENT
(DNO VARCHAR2 (20) PRIMARY KEY,
DNAME VARCHAR2 (20),
MGRSTARTDATE DATE);
```

```
CREATE TABLE EMPLOYEE
(SSN VARCHAR2 (20) PRIMARY KEY,
FNAME VARCHAR2 (20),
LNAME VARCHAR2 (20),
ADDRESS VARCHAR2 (20),
SEX CHAR (1),
SALARY INTEGER,
SUPERSSN REFERENCES EMPLOYEE (SSN),
DNO REFERENCES DEPARTMENT (DNO));
```

NOTE: Once DEPARTMENT and EMPLOYEE tables are created we must alter department table to add foreign constraint MGRSSN using sql command

```
ALTER TABLE DEPARTMENT  
ADD MGRSSN REFERENCES EMPLOYEE (SSN);
```

```
CREATE TABLE DLOCATION  
(DLOC VARCHAR2 (20),  
DNO REFERENCES DEPARTMENT (DNO),  
PRIMARY KEY (DNO, DLOC));
```

```
CREATE TABLE PROJECT  
(PNO INTEGER PRIMARY KEY,  
PNAME VARCHAR2 (20),  
PLOCATION VARCHAR2 (20),  
DNO REFERENCES DEPARTMENT (DNO));
```

```
CREATE TABLE WORKS_ON  
(HOURS NUMBER (2),  
SSN REFERENCES EMPLOYEE (SSN),  
PNO REFERENCES PROJECT(PNO),  
PRIMARY KEY (SSN, PNO));
```

Queries:

1. Make a list of all project numbers for projects that involve an employee whose last name is 'Scott', either as a worker or as a manager of the department that controls the project.

```
(SELECT DISTINCT P.PNO
FROM PROJECT P, DEPARTMENT D, EMPLOYEE E
WHERE E.DNO=D.DNO
AND D.MGRSSN=E.SSN
AND E.LNAME='SCOTT')
UNION
(SELECT DISTINCT P1.PNO
FROM PROJECT P1, WORKS_ON W, EMPLOYEE E1
WHERE P1.PNO=W.PNO
AND E1.SSN=W.SSN
AND E1.LNAME='SCOTT');
```

```

PNO
-----
100
101
102
103
104
105
106
107

```

2. Show the resulting salaries if every employee working on the 'IoT' project is given a 10 percent raise.

```

SELECT E.FNAME, E.LNAME, 1.1*E.SALARY AS INCR_SAL
FROM EMPLOYEE E, WORKS_ON W, PROJECT P
WHERE E.SSN=W.SSN
AND W.PNO=P.PNO
AND P.PNAME='IOT';

```

FNAME	LNAME	INCR_SAL
JAMES	SMITH	550000
HEARN	BAKER	770000
PAVAN	HEGDE	715000

3. Find the sum of the salaries of all employees of the 'Accounts' department, as well as the maximum salary, the minimum salary, and the average salary in this department

```

SELECT SUM (E.SALARY), MAX (E.SALARY), MIN (E.SALARY), AVG
(E.SALARY)
FROM EMPLOYEE E, DEPARTMENT D
WHERE E.DNO=D.DNO
AND D.DNAME='ACCOUNTS';

```

SUM(E.SALARY)	MAX(E.SALARY)	MIN(E.SALARY)	AVG(E.SALARY)
650000	350000	300000	325000

4. Retrieve the name of each employee who works on all the projects Controlled by department number 5 (use NOT EXISTS operator).

```

SELECT E.FNAME, E.LNAME
FROM EMPLOYEE E
WHERE NOT EXISTS((SELECT PNO
FROM PROJECT

```

```
WHERE DNO='5')
MINUS (SELECT PNO
FROM WORKS_ON
WHERE E.SSN=SSN));
```

FNAME	LNAME
JAMES	SMITH

5. For each department that has more than five employees, retrieve the department number and the number of its employees who are making more than Rs. 6,00,000.

```
SELECT D.DNO, COUNT (*)
FROM DEPARTMENT D, EMPLOYEE E
WHERE D.DNO=E.DNO
AND E.SALARY>600000
AND D.DNO IN (SELECT E1.DNO
FROM EMPLOYEE E1
GROUP BY E1.DNO
HAVING COUNT (*)>5)
GROUP BY D.DNO;
```

DNO	COUNT (*)
5	3

Viva Questions

1. What is SQL?

Structured Query Language

2. What is database?

A database is a logically coherent collection of data with some inherent meaning, representing some aspect of real world and which is designed, built and populated with data for a specific purpose.

3. What is DBMS?

It is a collection of programs that enables user to create and maintain a database. In other words it is general-purpose software that provides the users with the processes of defining, constructing and manipulating the database for various applications.

4. What is a Database system?

The database and DBMS software together is called as Database system.

5. Advantages of DBMS?

- Redundancy is controlled.
- Unauthorized access is restricted.
- Providing multiple user interfaces.
- Enforcing integrity constraints.
- Providing backup and recovery.

6. Disadvantage in File Processing System?

- Data redundancy & inconsistency.
- Difficult in accessing data.
- Data isolation.
- Data integrity.
- Concurrent access is not possible.
- Security Problems.

7. Describe the three levels of data abstraction?

There are three levels of abstraction:

- Physical level: The lowest level of abstraction describes how data are stored.
- Logical level: The next higher level of abstraction, describes what data are stored in database and what relationship among those data.

- View level: The highest level of abstraction describes only part of entire database.

8. Define the "integrity rules"

There are two Integrity rules.

- Entity Integrity: States that "Primary key cannot have NULL value"
- Referential Integrity: States that "Foreign Key can be either a NULL value or should be Primary Key value of other relation."

9. What is extension and intension?

Extension - It is the number of tuples present in a table at any instance. This is time dependent.

Intension - It is a constant value that gives the name, structure of table and the constraints laid on it.

10. What is Data Independence?

Data independence means that "the application is independent of the storage structure and access strategy of data". In other words, The ability to modify the schema definition in one level should not affect the schema definition in the next higher level.

Two types of Data Independence:

- Physical Data Independence: Modification in physical level should not affect the logical level.
- Logical Data Independence: Modification in logical level should affect the view level.

NOTE: Logical Data Independence is more difficult to achieve

11. What is a view? How it is related to data independence?

A view may be thought of as a virtual table, that is, a table that does not really exist in its own right but is instead derived from one or more underlying base table. In other words, there is no stored file that directly represents the view instead a definition of view is stored in data dictionary.

Growth and restructuring of base tables is not reflected in views. Thus the view can insulate users from the effects of restructuring and growth in the database. Hence accounts for logical data independence.

12. What is Data Model?

A collection of conceptual tools for describing data, data relationships data semantics and constraints.

13. What is E-R model?

This data model is based on real world that consists of basic objects called entities and of relationship among these objects. Entities are described in a database by a set of attributes.

14. What is Object Oriented model?

This model is based on collection of objects. An object contains values stored in instance variables within the object. An object also contains bodies of code that operate on the object. These bodies of code are called methods. Objects that contain same types of values and the same methods are grouped together into classes.

15. What is an Entity?

It is an 'object' in the real world with an independent existence.

16. What is an Entity type?

It is a collection (set) of entities that have same attributes.

17. What is an Entity set?

It is a collection of all entities of particular entity type in the database.

18. What is an Extension of entity type?

The collections of entities of a particular entity type are grouped together into an entity set.

19. What is an attribute?

It is a particular property, which describes the entity.

20. What is a Relation Schema and a Relation?

A relation Schema denoted by $R(A_1, A_2, \dots, A_n)$ is made up of the relation name R and the list of attributes A_i that it contains. A relation is defined as a set of tuples. Let r be the relation which contains set tuples $(t_1, t_2, t_3, \dots, t_n)$. Each tuple is an ordered list of n -values $t=(v_1, v_2, \dots, v_n)$.

21. What is degree of a Relation?

It is the number of attribute of its relation schema.

22. What is Relationship?

It is an association among two or more entities.

23. What is Relationship set?

The collection (or set) of similar relationships.

24. What is Relationship type?

Relationship type defines a set of associations or a relationship set among a given set of entity types.

25. What is degree of Relationship type?

It is the number of entity type participating.

26. What is DDL (Data Definition Language)?

A data base schema is specified by a set of definitions expressed by a special language called DDL.

27. What is VDL (View Definition Language)?

It specifies user views and their mappings to the conceptual schema.

28. What is SDL (Storage Definition Language)?

This language is to specify the internal schema. This language may specify the mapping between two schemas.

29. What is Data Storage - Definition Language?

The storage structures and access methods used by database system are specified by a set of definition in a special type of DDL called data storage- definition language.

30. What is DML (Data Manipulation Language)?

This language that enable user to access or manipulate data as organized by appropriate data model.

- Procedural DML or Low level: DML requires a user to specify what data are needed and how to get those data.
- Non-Procedural DML or High level: DML requires a user to specify what data are needed without specifying how to get those data.

31. What is DML Compiler?

It translates DML statements in a query language into low-level instruction that the query evaluation engine can understand.

32. What is Relational Algebra?

It is a procedural query language. It consists of a set of operations that take one or two relations as input and produce a new relation.

33. What is Relational Calculus?

It is an applied predicate calculus specifically tailored for relational databases proposed by E.F. Codd. E.g. of languages based on it are DSL, ALPHA, QUEL.

34. What is normalization?

It is a process of analyzing the given relation schemas based on their Functional Dependencies (FDs) and primary key to achieve the properties

- Minimizing redundancy
- Minimizing insertion, deletion and update anomalies.

35. What is Functional Dependency?

A Functional dependency is denoted by $X \rightarrow Y$ between two sets of attributes X and Y that are subsets of R specifies a constraint on the possible tuple that can form a relation state r of R . The constraint is for any two tuples t_1 and t_2 in r if $t_1[X] = t_2[X]$ then they have $t_1[Y] = t_2[Y]$. This means the value of X component of a tuple uniquely determines the value of component Y .

36. When is a functional dependency F said to be minimal?

- Every dependency in F has a single attribute for its right hand side.
- We cannot replace any dependency $X \rightarrow A$ in F with a dependency $Y \rightarrow A$ where Y is a proper subset of X and still have a set of dependency that is equivalent to F .
- We cannot remove any dependency from F and still have set of dependency that is equivalent to F .

37. What is Multivalued dependency?

Multivalued dependency denoted by $X \twoheadrightarrow Y$ specified on relation schema R , where X and Y are both subsets of R , specifies the following constraint on any relation r of R : if two tuples t_1 and t_2 exist in r such that $t_1[X] = t_2[X]$ then t_3 and t_4 should also exist in r with the following properties

- $t_3[X] = t_4[X] = t_1[X] = t_2[X]$
- $t_3[Y] = t_1[Y]$ and $t_4[Y] = t_2[Y]$
- $t_3[Z] = t_2[Z]$ and $t_4[Z] = t_1[Z]$

where $[Z = (R - (X \cup Y))]$

38. What is Lossless join property?

It guarantees that the spurious tuple generation does not occur with respect to relation schemas after decomposition.

39. What is 1 NF (Normal Form)?

The domain of attribute must include only atomic (simple, indivisible) values.

40. What is Fully Functional dependency?

It is based on concept of full functional dependency. A functional dependency $X \twoheadrightarrow Y$ is fully functional dependency if removal of any attribute A from X means that the dependency does not hold any more.

41. What is 2NF?

A relation schema R is in 2NF if it is in 1NF and every non-prime attribute A in R is fully functionally dependent on primary key.

42. What is 3NF?

A relation schema R is in 3NF if it is in 2NF and for every FD $X \twoheadrightarrow A$ either of the following is true

- X is a Super-key of R.
- A is a prime attribute of R.

In other words, if every non prime attribute is non-transitively dependent on primary key.

43. What is BCNF (Boyce-Codd Normal Form)?

A relation schema R is in BCNF if it is in 3NF and satisfies additional constraints that for every FD $X \rightarrow A$, X must be a candidate key.

44. What is 4NF?

A relation schema R is said to be in 4NF if for every Multivalued dependency $X \twoheadrightarrow Y$ that holds over R, one of following is true

- X is subset or equal to (or) $XY = R$.
- X is a super key.

45. What is 5NF?

A Relation schema R is said to be 5NF if for every join dependency $\{R_1, R_2, \dots, R_n\}$ that holds R, one the following is true

- $R_i = R$ for some i.
- The join dependency is implied by the set of FD, over R in which the left side is key of R.

46. What is Domain-Key Normal Form?

A relation is said to be in DKNF if all constraints and dependencies that should hold on the constraint can be enforced by simply enforcing the domain constraint and key constraint on the relation.
